

**FEATURES**

- Propagation Delay <2.3 ns
- Propagation Delay Skew <300 ps
- Low Power: 185 mW
- Low Offset  $\pm 3$  mV
- Low Feedthrough and Crosstalk
- Differential Latch Control

**APPLICATIONS**

- High-Speed Instrumentation, ATE
- High-Speed Timing
- Window Comparators
- Line Receivers
- A/D Conversion
- Threshold Detection

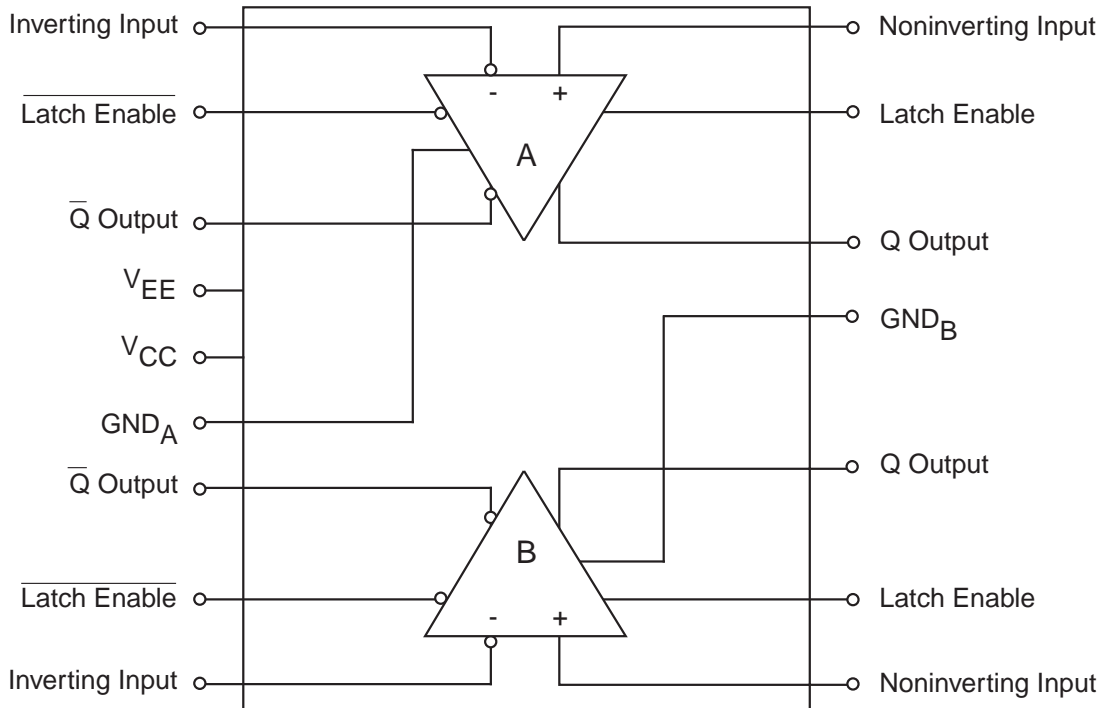

**GENERAL DESCRIPTION**

The SPT9687 is a dual, very high-speed monolithic comparator. It is pin compatible with, and has improved performance over Analog Device's AD9687. The SPT9687 is designed for use in Automatic Test Equipment (ATE), high-speed instrumentation, and other high-speed comparator applications.

Improvements over other sources include reduced power consumption, reduced propagation delays, and higher input impedance.

The SPT9687 is available in 16-lead SOIC, 16-lead plastic DIP, 20-lead PLCC and 20-contact LCC packages over the industrial temperature range. It is also available in die form.

**BLOCK DIAGRAM**

## ABSOLUTE MAXIMUM RATINGS (Beyond which damage may occur)<sup>1</sup> 25 °C

### Supply Voltages

Positive Supply (V <sub>CC</sub> to GND).....	-0.5 to +6.0 V
Negative Supply (V <sub>EE</sub> to GND) .....	-6.0 to +0.5 V
Ground Voltage Differential .....	-0.5 to +0.5 V

### Input Voltages

Input Voltage .....	-4.0 to +4.0 V
Differential Input Voltage .....	-5.0 to +5.0 V
Input Voltage, Latch Controls .....	V <sub>EE</sub> to 0.5 V

### Output

Output Current .....	30 mA
----------------------	-------

### Temperature

Operating Temperature, ambient .....	-25 to +85 °C
junction .....	+150 °C
Lead Temperature, (soldering 60 seconds) .....	+300 °C
Storage Temperature .....	-65 to +150 °C

**Note:** 1. Operation at any Absolute Maximum Rating is not implied. See Electrical Specifications for proper nominal applied conditions in typical applications.

## ELECTRICAL SPECIFICATIONS

T<sub>A</sub> = +25 °C, V<sub>CC</sub> = +5.0 V, V<sub>EE</sub> = -5.20 V, R<sub>L</sub> = 50 Ohm, unless otherwise specified.

## TEST LEVEL CODES

All electrical characteristics are subject to the following conditions:

All parameters having min/max specifications are guaranteed. The Test Level column indicates the specific device testing actually performed during production and Quality Assurance inspection. Any blank section in the data column indicates that the specification is not tested at the specified condition.

Unless otherwise noted, all tests are pulsed tests; therefore,  $T_J = T_C = T_A$ .

## TEST LEVEL

## TEST PROCEDURE

- I 100% production tested at the specified temperature.
- II 100% production tested at  $T_A=25\text{ }^\circ\text{C}$ , and sample tested at the specified temperatures.
- III QA sample tested only at the specified temperatures.
- IV Parameter is guaranteed (but not tested) by design and characterization data.
- V Parameter is a typical value for information purposes only.
- VI 100% production tested at  $T_A = 25\text{ }^\circ\text{C}$ . Parameter is guaranteed over specified temperature range.

Figure 1 - Timing Diagram

The set-up and hold times are a measure of the time required for an input signal to propagate through the first stage of the comparator to reach the latching circuitry. Input signals occurring before  $t_s$  will be detected and held; those occurring after  $t_H$  will not be detected. Changes between  $t_s$  and  $t_H$  may not be detected.

## SWITCHING TERMS (Refer to figure 1)

- $t_{pdH}$  INPUT TO OUTPUT HIGH DELAY - The propagation delay measured from the time the input signal crosses the reference voltage ( $\pm$  the input offset voltage) to the 50% point of an output LOW to HIGH transition.
- $t_{pdL}$  INPUT TO OUTPUT LOW DELAY - The propagation delay measured from the time the input signal crosses the reference voltage ( $\pm$  the input offset voltage) to the 50% point of an output HIGH to LOW transition.
- $t_{pLOH}$  LATCH ENABLE TO OUTPUT HIGH DELAY - The propagation delay measured from the 50% point of the Latch Enable signal LOW to HIGH transition to 50% point of an output LOW to HIGH transition.
- $V_{OD}$  VOLTAGE OVERDRIVE - The difference between the differential input and the reference voltages.
- $t_{pLOL}$  LATCH ENABLE TO OUTPUT LOW DELAY - The propagation delay measured from the 50% point of the Latch Enable signal LOW to HIGH transition to the 50% point of an output HIGH to LOW transition.
- $t_H$  MINIMUM HOLD TIME - The minimum time after the negative transition of the Latch Enable signal that the input signal must remain unchanged in order to be acquired and held at the outputs.
- $t_{pL}$  MINIMUM LATCH ENABLE PULSE WIDTH - The minimum time that the Latch Enable signal must be HIGH in order to acquire an input signal change.
- $t_s$  MINIMUM SET-UP TIME - The minimum time before the negative transition of the Latch Enable signal that an input signal change must be present in order to be acquired and held at the outputs.

## TIMING INFORMATION

The timing diagram for the comparator is shown in figure 1. The latch enable (LE) pulse is shown at the top. If LE is high and  $\overline{LE}$  low in the SPT9687, the comparator tracks the input difference voltage. When LE is driven low and  $\overline{LE}$  high, the comparator outputs are latched into their existing logic states.

The leading edge of the input signal (which consists of a 50 mV overdrive voltage) changes the comparator output after a time of  $t_{pdL}$  or  $t_{pdH}$  (Q or  $\overline{Q}$ ). The input signal must be maintained for a time  $t_s$  (set-up time) before the LE falling edge and  $\overline{LE}$  rising edge and held for time  $t_H$  after the falling edge and  $\overline{LE}$  rising edge and held for time  $t_H$  after the falling edge for the comparator to accept data. After  $t_H$ , the output ignores the input status until the latch is strobed again. A minimum latch pulse width of  $t_{pL}$  is needed for strobe operation, and the output transitions occur after a time of  $t_{pLOH}$  or  $t_{pLOL}$ .

## GENERAL INFORMATION

The SPT9687 is an ultrahigh-speed dual voltage comparator. It offers tight absolute characteristics. The device has differential analog inputs and complementary logic outputs compatible with ECL systems. The output stage is adequate for driving terminated 50 ohm transmission lines.

The SPT9687 has a complementary latch enable control for each comparator. Both should be driven by standard ECL logic levels.

The dual comparator shares the same  $V_{CC}$  and  $V_{EE}$  connections but have separate grounds for each comparator to achieve high crosstalk rejection.

Figure 2 - Internal Functional Diagram

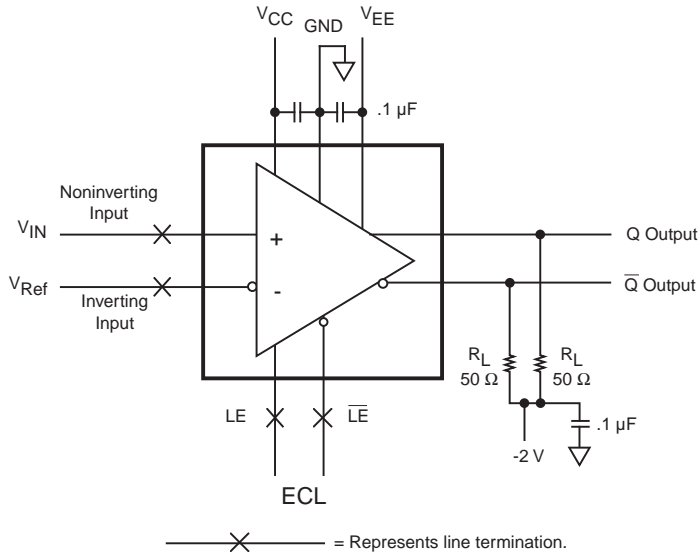

## TYPICAL INTERFACE CIRCUIT

The typical interface circuit using the comparator is shown in figure 3. Although it needs few external components and is easy to apply, there are several conditions that should be met to achieve optimal performance. The very high operating speeds of the comparator require careful layout, decoupling of supplies, and proper design of transmission lines.

Since the SPT9687 comparator is a very high frequency and high gain device, certain layout rules must be followed to avoid spurious oscillations. The comparator should be soldered to the board with component lead lengths kept as short as possible. A ground plane should be used, and the input impedance to the part should be kept as low as possible to decrease parasitic feedback. If the output board traces are longer than approximately one-half inch, microstripline techniques must be employed to prevent ringing on the output waveform. Also, the microstriplines must be terminated at the far end with the characteristic impedance of the line to prevent reflections. All supply voltage pins should be decoupled with high frequency capacitors as close to the device as possible. All ground and N/C pins should be connected to the same ground plane to further improve noise immunity and shielding. If using the SPT9687 as a single comparator, the outputs of the inactive comparator can be grounded, left open or terminated with 50 Ohms to -2 V. All outputs on the active comparator, whether used or unused, should have identical terminations to minimize ground current switching transients.

Note: To ensure proper power up of the device, the input should be kept below +1.5 V during power up.

**Figure 3 - Typical Interface Circuit**

**Figure 4 - Typical Interface With Hysteresis**

Hysteresis is obtained by applying a DC bias to the LE pin.

$$V_{LE} = -1.3 \text{ V} \pm 100 \text{ mV}, V_{LE} = -1.3 \text{ V.}$$

—X— Represents line termination.

## DISCLAIMER

FAIRCHILD SEMICONDUCTOR RESERVES THE RIGHT TO MAKE CHANGES WITHOUT FURTHER NOTICE TO ANY PRODUCTS HEREIN TO IMPROVE RELIABILITY, FUNCTION OR DESIGN. FAIRCHILD DOES NOT ASSUME ANY LIABILITY ARISING OUT OF THE APPLICATION OR USE OF ANY PRODUCT OR CIRCUIT DESCRIBED HEREIN; NEITHER DOES IT CONVEY ANY LICENSE UNDER ITS PATENT RIGHTS, NOR THE RIGHTS OF OTHERS.

## LIFE SUPPORT POLICY

FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT OF FAIRCHILD SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform, when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
